**Abstract:**

This specification defines a syntax for the definition of authentication context declarations and an initial list of authentication context classes for use with SAML.

**Status:**

This is an **OASIS Standard** document produced by the Security Services Technical Committee. It was approved by the OASIS membership on 1 March 2005.

Committee members should submit comments and potential errata to the security-services@lists.oasis-open.org list. Others should submit them by filling out the web form located at http://www.oasis-open.org/committees/comments/form.php?wg_abbrev=security. The committee will publish on its web page (http://www.oasis-open.org/committees/security) a catalog of any changes made to this document.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights web page for the Security Services TC (http://www.oasis-open.org/committees/security/ipr.php).

# Table of Contents

# 1 Introduction

This specification defines a syntax for the definition of authentication context declarations and an initial list of authentication context classes.

## 1.1 Authentication Context Concepts

If a relying party is to rely on the authentication of a principal by an authentication authority, the relying party may require information additional to the assertion itself in order to assess the level of confidence they can place in that assertion. This specification defines an XML Schema for the creation of Authentication Context declarations - XML documents that allow the authentication authority to provide to the relying party this additional information. Additionally, this specification defines a number of Authentication Context classes; categories into which many Authentication Context declarations will fall, thereby simplifying their interpretation.

The OASIS Security Assertion Markup Language does not prescribe a single technology, protocol, or policy for the processes by which authentication authorities issue identities to principals and by which those principals subsequently authenticate themselves to the authentication authority. Different authentication authorities will choose different technologies, follow different processes, and be bound by different legal obligations with respect to how they authenticate principals.

The choices that an authentication authority makes here will be driven in large part by the requirements of the relying parties with which the authentication authority interacts. These requirements themselves will be determined by the nature of the service (that is, the sensitivity of any information exchanged, the associated financial value, the relying parties' risk tolerance, etc.) that the relying party will be providing to the principal.

Consequently, for anything other than trivial services, if the relying party is to place sufficient confidence in the authentication assertions it receives from an authentication authority, it will be necessary for it to know which technologies, protocols, and processes were used or followed for the original authentication mechanism on which the authentication assertion is based. Armed with this information and trusting the origin of the actual assertion, the relying party will be better able to make an informed entitlements decision regarding what services the subject of the authentication assertion should be allowed to access.

*Authentication context* is defined as the information, additional to the authentication assertion itself, that the relying party may require before it makes an entitlements decision with respect to an authentication assertion. Such context may include, *but is not limited to*, the actual authentication method used (see the SAML assertions and protocols specification [SAMLCore] for more information).

## 1.2 Notation and Terminology

The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this specification are to be interpreted as described in IETF RFC 2119 [RFC 2119].

```
Listings of XML schemas appear like this.
```

```
Example code listings appear like this.
```

This specification uses schema documents conforming to W3C XML Schema [Schema1] and normative text to describe the syntax and semantics of XML-encoded SAML assertions and protocol messages. In cases of disagreement between the SAML authentication context schema documents and schema listings in this specification, the schema documents take precedence. Note that in some cases the normative text of this specification imposes constraints beyond those indicated by the schema documents.

Conventional XML namespace prefixes are used throughout the listings in this specification to stand for

149 their respective namespaces as follows, whether or not a namespace declaration is present in the
150 example:

| Prefix | XML Namespace | Comments |
|---|---|---|
| `ac:` | urn:oasis:names:tc:SAML:2.0:ac | This is the namespace defined in this specification and in a schema [SAMLAC-xsd]. |
| `xs:` | http://www.w3.org/2001/XMLSchema | This namespace is defined in the W3C XML Schema specification [Schema1]. |

151

152 This specification uses the following typographical conventions in text: `<SAMLElement>`,
153 `<ns:ForeignElement>`, `XMLAttribute`, **Datatype**, `OtherKeyword`.

# 2 Authentication Context Declaration

If a relying party is to rely on the authentication of another entity by an authentication authority, the relying party may require information additional to the authentication itself to allow it to put the authentication into a risk-management context. This information could include:

- The initial user identification mechanisms (for example, face-to-face, online, shared secret).
- The mechanisms for minimizing compromise of credentials (for example, credential renewal frequency, client-side key generation).
- The mechanisms for storing and protecting credentials (for example, smartcard, password rules).
- The authentication mechanism or method (for example, password, certificate-based SSL).

The variations and permutations in the characteristics listed above guarantee that not all authentication assertions will be the same with respect to the confidence that a relying party can place in it; a particular authentication assertion will be characterized by the values for each of these (and other) variables.

A SAML authentication authority can deliver to a relying party the additional authentication context information in the form of an authentication context declaration, an XML document either inserted directly or referenced within the authentication assertion that the authentication authority provides to the relying party.

SAML requesters are able to request that an authentication comply with a specified authentication context by identifying that context in an authentication request. A requester may also specify that an authentication must be conducted with an authentication context that *exceeds* some stated value (for some agreed definition of "exceeds"). See the SAML assertions and protocols specification [SAMLCore] for more information.

## 2.1 Data Model

A particular authentication context declaration defined in this specification will capture characteristics of the processes, procedures, and mechanisms by which the authentication authority verified the subject before issuing an identity, protects the secrets on which subsequent authentications are based, and the mechanisms used for this authentication. These characteristics are categorized in the Authentication Context schema as follows:

- Identification - Characteristics that describe the processes and mechanism the authentication authority uses to initially create an association between a subject and the identity (or name) by which the subject will be known.
- Technical Protection - Characteristics that describe how the "secret" (the knowledge or possession of which allows the subject to authenticate to the authentication authority) is kept secure.
- Operational Protection - Characteristics that describe procedural security controls employed by the authentication authority (for example, security audits, records archival).
- Authentication Method - Characteristics that define the mechanisms by which the subject of the issued assertion authenticates to the authentication authority (for example, a password versus a smartcard).
- Governing Agreements - Characteristics that describe the legal framework (e.g. liability constraints and contractual obligations) underlying the authentication event and/or its associated technical authentication infrastructure.

## 2.2 Extensibility

The authentication context declaration schema [SAMLAC-xsd] has well-defined extensibility points through the <Extension> element. Authentication authorities can use this element to insert additional authentication context details for the SAML assertions they issue (assuming that the consuming relying party will be able to understand these extensions). These additional elements MUST be in a separate XML Namespace to that of the authentication context declaration base or class schema that applies to the declaration itself.

## 2.3 Processing Rules

Additional processing rules for authentication context declarations are specified in the SAML assertions and protocols specification [SAMLCore]. Note that in most respects, these processing rules amount to deployments sharing common interpretations of the relative strength or quality of particular authentication context declarations and cannot be expressed in absolute terms or provided as rules that implementations must follow.

## 2.4 Schema

This section lists the complete Authentication Context Types XML Schema [SAMLAC-Types], and the Authentication Context XML schema [SAMLAC-xsd] itself, used for the validation of individual generalized declarations. The types schema has no target namespace itself, and is then included by [SAMLAC-xsd].

# 3 Authentication Context Classes

The number of permutations of different characteristics ensures that there is a theoretically infinite number of unique authentication contexts. The implication is that, in theory, any particular relying party would be expected to be able to parse arbitrary authentication context declarations and, more importantly, to analyze the declaration in order to assess the "quality" of the associated authentication assertion. Making such an assessment is non-trivial.

Fortunately, an optimization is possible. In practice many authentication contexts will fall into categories determined by industry practices and technology. For instance, many B2C web browser authentication contexts will be (partially) defined by the principal authenticating to the authentication authority through the presentation of a password over an SSL protected session. In the enterprise world, certificate-based authentication will be common. Of course, the full authentication context is not limited to the specifics of how the principal authenticated. Nevertheless, the authentication method is often the most visible characteristic and as such, can serve as a useful classifer for a class of related authentication contexts.

The concept is expressed in this specification as a definition of a series of authentication context classes. Each class defines a proper subset of the full set of authentication contexts. Classes have been chosen as representative of the current practices and technologies for authentication technologies, and provide asserting and relying parties a convenient shorthand when referring to authentication context issues.

For instance, an authentication authority may include with the complete authentication context declaration it provides to a relying party an assertion that the authentication context also belongs to an authentication context class. For some relying parties, this assertion is sufficient detail for it to be able to assign an appropriate level of confidence to the associated authentication assertion. Other relying parties might prefer to examine the complete authentication context declaration itself. Likewise, the ability to refer to an authentication context class rather than being required to list the complete details of a specific authentication context declaration will simplify how the relying party can express its desires and/or requirements to an authentication authority.

## 3.1 Advantages of Authentication Context Classes

The introduction of the additional layer of classes and the definition of an initial list of representative and flexible classes are expected to:

- Make it easier for the authentication authority and relying party to come to an agreement on what are acceptable authentication contexts by giving them a framework for discussion.
- Make it easier for relying parties to indicate their preferences when requesting a step-up authentication assertion from an authentication authority.
- Simplify for relying parties the burden of processing authentication context declarations by giving them the option of being satisfied by the associated class.
- Insulate relying parties from the impact of new authentication technologies.
- Make it easier for authentication authorities to publish their authentication capabilities, for example, through WSDL.

## 3.2 Processing Rules

Further processing rules for authentication context classes are described in the SAML assertions and protocols specification [SAMLCore]. Note that in most respects, these processing rules amount to deployments sharing common interpretations of the relative strength or quality of particular authentication context classes and cannot be expressed in absolute terms or provided as rules that implementations must follow.

## 3.3 Extensibility

As does the core authentication context declaration schema, the separate authentication context class schemas allow the <Extension> element in certain locations of the tree structure. In general, where the <Extension> element occurred as a child of an <xs:choice> element, this option was removed in creating the appropriate class schema definition as a restriction of the base type. When the <Extension> element occurred as an optional child of an <xs:sequence> element, the <Extension> element was allowed to remain in addition to any required elements.

Consequently, authentication context declarations can include the <Extension> element (with additional elements in different namespaces) and still conform to authentication context class schemas (if they meet the other requirements of the schema of course).

The authentication context class schemas restrict type definitions in the base authentication context schema. As an extension point, the authentication context class schemas themselves can be further restricted – their type definitions serving as base types in some other schema (potentially defined by some community wishing a more tightly defined authentication context class). To prevent logical inconsistencies, any such schema extensions can only further constrain the type definitions of the class schema. To enforce this constraint, the authentication context class schemas are defined with the finalDefault="extension" attribute on the <schema> element to prevent this type of derivation.

Additional authentication context classes MAY be developed by groups other than the Security Services Technical Committee. OASIS members may wish to document and submit them for consideration by the SSTC in a future version of the specification, and other groups may simply wish to inform the committee of their work. Please refer to the SSTC web site for further details.

Guidelines for the specification of new context classes are as follows:

- Specify a URI that uniquely identifies the context class.
- Provide contact information for the author of the class.
- Provide a textual description of the circumstances under which this class should be used.
- Provide a valid XML schema [Schema1] document implementing the class.

Authors of new classes are encouraged to review the classes defined within this specification in order to guide their work.

## 3.4 Schemas

Authentication context classes are listed in the following sub-sections. The classes are listed in alphabetical order; no other ranking is implied by the order of classes. Classes are uniquely identified by URIs with the following initial stem:

```
urn:oasis:names:tc:SAML:2.0:ac:classes
```

The class schemas are defined as restrictions of parts of the base authentication context "types" schema. XML instances that validate against a given authentication context class schema are said to *conform* to that authentication context class.

Note that because the class schema imports and redefines the elements and types into the class schema namespace, a class-conforming authentication context declaration does not simultaneously validate against the base authentication context schema.

### 3.4.1 Internet Protocol

**URI:** urn:oasis:names:tc:SAML:2.0:ac:classes:InternetProtocol

Note that this URI is also used as the target namespace in the corresponding authentication context class schema document [SAMLAC-IP].

The Internet Protocol class is applicable when a principal is authenticated through the use of a provided IP address.

```
<?xml version="1.0" encoding="UTF-8"?>

    </xs:annotation>

    <xs:complexType name="AuthnContextDeclarationBaseType">
      <xs:complexContent>
        <xs:restriction base="AuthnContextDeclarationBaseType">
          <xs:sequence>
            <xs:element ref="Identification" minOccurs="0"/>
            <xs:element ref="TechnicalProtection" minOccurs="0"/>
            <xs:element ref="OperationalProtection" minOccurs="0"/>
            <xs:element ref="AuthnMethod"/>
            <xs:element ref="GoverningAgreements" minOccurs="0"/>
            <xs:element ref="Extension" minOccurs="0" maxOccurs="unbounded"/>
          </xs:sequence>
          <xs:attribute name="ID" type="xs:ID" use="optional"/>
        </xs:restriction>
      </xs:complexContent>
    </xs:complexType>

    <xs:complexType name="AuthnMethodBaseType">
      <xs:complexContent>
        <xs:restriction base="AuthnMethodBaseType">
          <xs:sequence>
            <xs:element ref="PrincipalAuthenticationMechanism" minOccurs="0"/>
            <xs:element ref="Authenticator"/>
            <xs:element ref="AuthenticatorTransportProtocol" minOccurs="0"/>
            <xs:element ref="Extension" minOccurs="0" maxOccurs="unbounded"/>
          </xs:sequence>
        </xs:restriction>
      </xs:complexContent>
    </xs:complexType>

    <xs:complexType name="AuthenticatorBaseType">
      <xs:complexContent>
        <xs:restriction base="AuthenticatorBaseType">
          <xs:sequence>
            <xs:element ref="IPAddress"/>
          </xs:sequence>
        </xs:restriction>
      </xs:complexContent>
    </xs:complexType>

  </xs:redefine>
```

```
</xs:schema>
```

### 3.4.2 InternetProtocolPassword

**URI:** urn:oasis:names:tc:SAML:2.0:ac:classes:InternetProtocolPassword

Note that this URI is also used as the target namespace in the corresponding authentication context class schema document [SAMLAC-IPP].

The Internet Protocol Password class is applicable when a principal is authenticated through the use of a provided IP address, in addition to a username/password.

```
<?xml version="1.0" encoding="UTF-8"?>

<xs:schema
  targetNamespace="urn:oasis:names:tc:SAML:2.0:ac:classes:InternetProtocolPassw
ord"
  xmlns:ac="urn:oasis:names:tc:SAML:2.0:ac"

### 3.4.3 Kerberos

**URI:** urn:oasis:names:tc:SAML:2.0:ac:classes:Kerberos

Note that this URI is also used as the target namespace in the corresponding authentication context class schema document [SAMLAC-Kerb].

This class is applicable when the principal has authenticated using a password to a local authentication authority, in order to acquire a Kerberos ticket. That Kerberos ticket is then used for subsequent network authentication.

> **Note:** It is possible for the authentication authority to indicate (via this context class) a pre-authentication data type which was used by the Kerberos Key Distribution Center [RFC 1510] when authenticating the principal. The method used by the authentication authority to obtain this information is outside of the scope of this specification, but it is strongly recommended that a trusted method be deployed to pass the pre-authentication data type and any other Kerberos related context details (e.g. ticket lifetime) to the authentication authority.

```

An example of an XML instance conforming to this class schema is as follows:

```
<AuthenticationContextDeclaration
  xmlns="urn:oasis:names:tc:SAML:2.0:ac:classes:Kerberos">

  <AuthnMethod>

    <PrincipalAuthenticationMechanism preauth="0">
      <RestrictedPassword>
        <Length min="4"/>
      </RestrictedPassword>
    </PrincipalAuthenticationMechanism>

    <Authenticator>
      <AuthenticatorSequence>
        <SharedSecretChallengeResponse
method="urn:oasis:names:tc:SAML:2.0:ac:classes:Kerberos"/>
      </AuthenticatorSequence>
    </Authenticator>

  </AuthnMethod>

</AuthenticationContextDeclaration>
```

### 3.4.4 MobileOneFactorUnregistered

**URI:** urn:oasis:names:tc:SAML:2.0:ac:classes:MobileOneFactorUnregistered

Note that this URI is also used as the target namespace in the corresponding authentication context class schema document [SAMLAC-MOFU].

Reflects no mobile customer registration procedures and an authentication of the mobile device without requiring explicit end-user interaction. This context class authenticates only the device and never the user; it is useful when services other than the mobile operator want to add a secure device authentication to their authentication process.

```

### 3.4.5 MobileTwoFactorUnregistered

**URI:** urn:oasis:names:tc:SAML:2.0:ac:classes:MobileTwoFactorUnregistered

Note that this URI is also used as the target namespace in the corresponding authentication context class schema document [SAMLAC-MTFU].

Reflects no mobile customer registration procedures and a two-factor based authentication, such as secure device and user PIN. This context class is useful when a service other than the mobile operator wants to link their customer ID to a mobile supplied two-factor authentication service by capturing mobile phone data at enrollment.

```

## 3.4.6 MobileOneFactorContract

**URI:** urn:oasis:names:tc:SAML:2.0:ac:classes:MobileOneFactorContract

Note that this URI is also used as the target namespace in the corresponding authentication context class schema document [SAMLAC-MOFC].

Reflects mobile contract customer registration procedures and a single factor authentication. For example, a digital signing device with tamper resistant memory for key storage, such as the mobile MSISDN, but no required PIN or biometric for real-time user authentication.

```

### 3.4.7 MobileTwoFactorContract

**URI:** urn:oasis:names:tc:SAML:2.0:ac:classes:MobileTwoFactorContract

Note that this URI is also used as the target namespace in the corresponding authentication context class schema document [SAMLAC-MTFC].

Reflects mobile contract customer registration procedures and a two-factor based authentication. For example, a digital signing device with tamper resistant memory for key storage, such as a GSM SIM, that requires explicit proof of user identity and intent, such as a PIN or biometric.

```

        Revision history:
          V2.0 (March, 2005):
            New authentication context class schema for SAML V2.0.
      </xs:documentation>
    </xs:annotation>

    <xs:complexType name="AuthnContextDeclarationBaseType">
      <xs:complexContent>
        <xs:restriction base="AuthnContextDeclarationBaseType">
          <xs:sequence>
            <xs:element ref="Identification" minOccurs="0"/>
            <xs:element ref="TechnicalProtection" minOccurs="0"/>
            <xs:element ref="OperationalProtection" minOccurs="0"/>
            <xs:element ref="AuthnMethod"/>
            <xs:element ref="GoverningAgreements" minOccurs="0"/>
            <xs:element ref="Extension" minOccurs="0" maxOccurs="unbounded"/>
          </xs:sequence>
          <xs:attribute name="ID" type="xs:ID" use="optional"/>
        </xs:restriction>
      </xs:complexContent>
    </xs:complexType>

    <xs:complexType name="AuthnMethodBaseType">
      <xs:complexContent>
        <xs:restriction base="AuthnMethodBaseType">
          <xs:sequence>
            <xs:element ref="PrincipalAuthenticationMechanism" minOccurs="0"/>
            <xs:element ref="Authenticator"/>
            <xs:element ref="AuthenticatorTransportProtocol" minOccurs="0"/>
            <xs:element ref="Extension" minOccurs="0" maxOccurs="unbounded"/>
          </xs:sequence>
        </xs:restriction>
      </xs:complexContent>
    </xs:complexType>

    <xs:complexType name="AuthenticatorBaseType">
      <xs:complexContent>
        <xs:restriction base="AuthenticatorBaseType">
          <xs:sequence>
            <xs:element ref="RestrictedPassword"/>
          </xs:sequence>
        </xs:restriction>
      </xs:complexContent>
    </xs:complexType>

  </xs:redefine>

</xs:schema>
```

Following is an example of an XML instance that conforms to the context class schema:

```
<AuthenticationContextDeclaration
  xmlns="urn:oasis:names:tc:SAML:2.0:ac:classes:Password">

  <AuthnMethod>
    <Authenticator>
      <AuthenticatorSequence>
        <RestrictedPassword>
          <Length min="4"/>
        </RestrictedPassword>
      </AuthenticatorSequence>
    </Authenticator>
  </AuthnMethod>

</AuthenticationContextDeclaration>
```

### 3.4.9 PasswordProtectedTransport

**URI:** urn:oasis:names:tc:SAML:2.0:ac:classes:PasswordProtectedTransport

Note that this URI is also used as the target namespace in the corresponding authentication context class schema document [SAMLAC-PPT].

The PasswordProtectedTransport class is applicable when a principal authenticates to an authentication authority through the presentation of a password over a protected session.

```
<?xml version="1.0" encoding="UTF-8"?>

<xs:schema
targetNamespace="urn:oasis:names:tc:SAML:2.0:ac:classes:PasswordProtectedTransp
ort"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  xmlns="urn:oasis:names:tc:SAML:2.0:ac:classes:PasswordProtectedTransport"
  finalDefault="extension"
  blockDefault="substitution"
  version="2.0">

  <xs:redefine schemaLocation="saml-schema-authn-context-types-2.0.xsd">

    <xs:annotation>
      <xs:documentation>

        </xs:restriction>
      </xs:complexContent>
    </xs:complexType>

  </xs:redefine>

</xs:schema>
```

### 3.4.10 PreviousSession

**URI:** urn:oasis:names:tc:SAML:2.0:ac:classes:PreviousSession

Note that this URI is also used as the target namespace in the corresponding authentication context class schema document [SAMLAC-Prev].

The PreviousSession class is applicable when a principal had authenticated to an authentication authority at some point in the past using any authentication context supported by that authentication authority. Consequently, a subsequent authentication event that the authentication authority will assert to the relying party may be significantly separated in time from the principal's current resource access request.

The context for the previously authenticated session is explicitly not included in this context class because the user has not authenticated during this session, and so the mechanism that the user employed to authenticate in a previous session should not be used as part of a decision on whether to now allow access to a resource.

```
    <?xml version="1.0" encoding="UTF-8"?>
```

```

# Appendix A. Acknowledgments

The editors would like to acknowledge the contributions of the OASIS Security Services Technical Committee, whose voting members at the time of publication were:

- Conor Cahill, AOL
- John Hughes, Atos Origin
- Hal Lockhart, BEA Systems
- Mike Beach, Boeing
- Rebekah Metz, Booz Allen Hamilton
- Rick Randall, Booz Allen Hamilton
- Ronald Jacobson, Computer Associates
- Gavenraj Sodhi, Computer Associates
- Thomas Wisniewski, Entrust
- Carolina Canales-Valenzuela, Ericsson
- Dana Kaufman, Forum Systems
- Irving Reid, Hewlett-Packard
- Guy Denton, IBM
- Heather Hinton, IBM
- Maryann Hondo, IBM
- Michael McIntosh, IBM
- Anthony Nadalin, IBM
- Nick Ragouzis, Individual
- Scott Cantor, Internet2
- Bob Morgan, Internet2
- Peter Davis, Neustar
- Jeff Hodges, Neustar
- Frederick Hirsch, Nokia
- Senthil Sengodan, Nokia
- Abbie Barbir, Nortel Networks
- Scott Kiester, Novell
- Cameron Morris, Novell
- Paul Madsen, NTT
- Steve Anderson, OpenNetwork
- Ari Kermaier, Oracle
- Vamsi Motukuru, Oracle
- Darren Platt, Ping Identity
- Prateek Mishra, Principal Identity
- Jim Lien, RSA Security
- John Linn, RSA Security
- Rob Philpott, RSA Security
- Dipak Chopra, SAP
- Jahan Moreh, Sigaba
- Bhavna Bhatnagar, Sun Microsystems
- Eve Maler, Sun Microsystems

- Ronald Monzillo, Sun Microsystems
- Emily Xu, Sun Microsystems
- Greg Whitehead, Trustgenix

The editors also would like to acknowledge the following former SSTC members for their contributions to this or previous versions of the OASIS Security Assertions Markup Language Standard:

- Stephen Farrell, Baltimore Technologies
- David Orchard, BEA Systems
- Krishna Sankar, Cisco Systems
- Zahid Ahmed, CommerceOne
- Tim Alsop, CyberSafe Limited
- Carlisle Adams, Entrust
- Tim Moses, Entrust
- Nigel Edwards, Hewlett-Packard
- Joe Pato, Hewlett-Packard
- Bob Blakley, IBM
- Marlena Erdos, IBM
- Marc Chanliau, Netegrity
- Chris McLaren, Netegrity
- Lynne Rosenthal, NIST
- Mark Skall, NIST
- Charles Knouse, Oblix
- Simon Godik, Overxeer
- Charles Norwood, SAIC
- Evan Prodromou, Securant
- Robert Griffin, RSA Security (former editor)
- Sai Allarvarpu, Sun Microsystems
- Gary Ellison, Sun Microsystems
- Chris Ferris, Sun Microsystems
- Mike Myers, Traceroute Security
- Phillip Hallam-Baker, VeriSign (former editor)
- James Vanderbeek, Vodafone
- Mark O'Neill, Vordel
- Tony Palmer, Vordel

Finally, the editors wish to acknowledge the following people for their contributions of material used as input to the OASIS Security Assertions Markup Language specifications:

- Thomas Gross, IBM
- Birgit Pfitzmann, IBM

# Appendix B. Notices

OASIS takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information on OASIS's procedures with respect to rights in OASIS specifications can be found at the OASIS website. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementors or users of this specification, can be obtained from the OASIS Executive Director.

OASIS invites any interested party to bring to its attention any copyrights, patents or patent applications, or other proprietary rights which may cover technology that may be required to implement this specification. Please address the information to the OASIS Executive Director.
